

Call for Research Questions

Do you have questions about ecological and associated socio-economic tipping points due to cumulative effects?

Would you like your questions to inform future research?

The Canadian Centre for Evidence-Based Conservation and the Fish Ecology and Conservation Physiology Laboratory at Carleton University are developing a research agenda on tipping points and cumulative effects to identify current knowledge gaps on this topic. Your responses will assist in generating a research agenda to guide future empirical research on tipping points and cumulative effects in marine, terrestrial, and freshwater ecosystems.
